

Amendments to the Specification:

Please replace the paragraph beginning at page 1, line 29, with the following rewritten paragraph:

–One solution consists in making the zones that cause parasitic light rays matt, by texturing (~~granulations~~, grainings, ridges) the mould that is used to produce the mask.–

Please replace the paragraph beginning at page 2, line 13, with the following rewritten paragraph:

– Finally, in the case of a reflector, the material used is a thermosetting material, an injected metal or stamped sheet metal, since the reflector is used for full beam lights which heat up to high temperatures, thereby making it impossible to use a thermoplastics material; for this type of thermosetting material, the ~~granulating~~ texturing of the mould is impossible since it causes problems of crumbling at the time of removal from the mould.–

Please replace the paragraph beginning at page 3, line 16, with the following rewritten paragraph:

–The laser exposure directly on the plastics material makes it possible for example to ~~granulate~~ or texture part of the plastic surface, this part becoming less reflective after metallization.–

Please replace the paragraph beginning at page 4, line 6, with the following rewritten paragraph:

–According to a second embodiment, the predetermined material is a plastics material and said step of exposure to laser radiation is a step of ~~granulating~~ texturing said surface of plastics material.–

Please replace the paragraph beginning at page 4, line 10, with the following rewritten paragraph:

–Advantageously, said ~~granulating~~ texturing step is followed by a step of metallizing said component.–

Please replace the paragraph beginning at page 5, line 15, with the following rewritten paragraph:

– It is thus possible to produce a reflector having surfaces that reflect light in order to exert their optical function and surfaces that are not reflective, making it possible to eliminate parasitic reflections. The non-reflective surface is obtained either by ~~granulating~~ texturing the plastics material and then metallizing, or by attacking a metallized part in order to modify the texture of the metal. It is possible to produce a plurality of surfaces that do not reflect light in the same zone, the reflection of the light being weaker the higher the number of surfaces. It is moreover possible to use just one manufacturing mould to produce two types of reflector, depending on whether the vehicle is a vehicle with right-hand or left-hand drive, the step of selective exposure to laser radiation making it possible to differentiate the reflectors.–

Please replace the paragraph beginning at page 9, line 28, with the following rewritten paragraph:

– The thermoplastic zones corresponding to the surfaces 38 are first ~~granulated~~ or textured by exposure to laser radiation of the YAG type. A CO₂ laser or a laser of the excimer type may also be used.–

Please replace the paragraph beginning at page 10, line 3, with the following rewritten paragraph:

– A mask 33 is thus obtained that is completely metallized and comprises two ~~granulated~~ textured and metallized surfaces 38 on which light is not reflected; the presence of parasitic light rays is thus avoided.–
